

A live TRON wallet and token system built around direct buy, 14-day unlocks, liquidity routing, and growth rails.

The short version of the investor deck: what exists, why it matters, how the loop works, and where capital or strategic help can accelerate the system.

PRODUCT

Wallet-first token flow

Users enter through the app surface: buy, unlock, swap, liquidity, ambassador, and proof routes are framed as one product loop.

MECHANICS

90 / 7 / 3 buy routing

Every direct buy routes TRX across liquidity, controller, and airdrop sides in the same transaction.

RETENTION

14-day batch unlock

Tokens are minted immediately but unlock per purchase batch after 14 days, turning entry timing into visible wallet state.

SCALE PATH

Growth rails already exist

Ambassador accounting, airdrop funding, verification routes, and public proof pages form a distribution base.

NETWORK TRON

Low-fee environment for purchase, unlock visibility, and wallet-led actions.

PRIMARY SURFACES App + site

The app carries the flow; the website carries education, proof, and investor context.

ENTRY RULE 90 / 7 / 3

Buy-side routing splits liquidity, controller, and airdrop funding inside the transaction.

UNLOCK RULE 14 days

Each purchase has its own unlock batch instead of one opaque wallet-wide lock.

PROOF POINTS

On-chain architecture is separated

Token, controller, liquidity controller, bootstrapper, and vault contracts carry distinct responsibilities.

Wallet UX already maps the system

The app surfaces direct buy, unlock timeline, swap, liquidity, ambassador cabinet, and information routes.

Public proof is shareable

Whitepaper, verification, blog context, investor deck, and this one-pager give partners different depths of review.

STRATEGIC ASK

Capital plus distribution, liquidity confidence, regional reach, market access, or ecosystem credibility.
